

Air Conditioning Troubleshooting Tips

Before calling for service, check to confirm that the:

- Thermostat is set to “cool” and the temperature is set below the room temperature.
- Blower panel cover is installed correctly for the furnace blower (fan) to operate. Similar to the way a clothes dryer door operates, this panel pushes in a button that lets the fan motor know it is safe to come on. If that button is not pushed in, the furnace will not operate.
- Air conditioner and furnace breakers on the main electrical panel are on. (Remember if a breaker trips you must turn it from the tripped position to the off position before you can turn it back on.)
- 220 Switch on the outside wall near the air conditioner is on.
- Switch on the side of the furnace is on.
- Fuse in furnace is good (see manufacturer literature for size & location).
- Filter is in clean condition which allows air flow.
- Vents in individual rooms are open.
- Air returns are unobstructed.
- Air conditioner has not frozen from overuse.
- Humidifier is turned off.

Even if the troubleshooting tips do not identify a solution, the information you gather will be useful to the service provider you call.

Just a reminder the components of the air-conditioning system are covered by the manufacturers warranty and are excluded from the Classic Homes Limited Warranty. Classic is only responsible for Defects resulting from the original installation.

Thank you for your purchase of a Classic Home!
